

What is a vehicle energy storage device?

With the present technology, chemical batteries, flywheel systems, and ultracapacitors are the main candidates for the vehicle energy storage device. The chemical battery is an energy storage device that stores energy in the chemical form and exchanges its energy with outside devices in electric form.

What are the two components of a vehicle's energy storage system?

The electric load of a vehicle can be decomposed into two components - static and dynamic load. The static component is slowly varying power with limited magnitude, whereas the dynamic load is fast varying power with large magnitude. The energy storage system, accordingly, comprises of two basic elements.
