

What does the European Commission say about energy storage?

The Commission adopted in March 2023 a list of recommendations to ensure greater deployment of energy storage, accompanied by a staff working document, providing an outlook of the EU's current regulatory, market, and financing framework for storage and identifies barriers, opportunities and best practices for its development and deployment.

Why is energy storage important in Europe?

In Europe, there is a growing consensus amongst policymakers that energy storage is crucial to securing affordable and low carbon energy. In May 2022, European Union launched their REPowerEU plan, a part of the European Green Deal, which mandates that 45% of Europe's energy generation needs to come from renewable sources by 2030.

Why should EU countries consider the 'consumer-producer' role of energy storage?

It addresses the most important issues contributing to the broader deployment of energy storage. EU countries should consider the double 'consumer-producer' role of storage by applying the EU electricity regulatory framework and by removing barriers, including avoiding double taxation and facilitating smooth permitting procedures.

How much energy storage will Europe have in 2022?

Many European energy-storage markets are growing strongly, with 2.8 GW (3.3 GWh) of utility-scale energy storage newly deployed in 2022, giving an estimated total of more than 9 GWh. Looking forward, the International Energy Agency (IEA) expects global installed storage capacity to expand by 56% in the next 5 years to reach over 270 GW by 2026.

Does energy storage need a regulatory framework?

Regulatory framework must include energy storage as a stand-alone agent. Grid codes in many European countries consider energy storage as consumers while charging and generators when discharging, which makes them compliant to various regulations pertaining to both market participants.

Why is energy storage a problem in Europe?

The fact that it happens in many European countries is a result of energy storage being seen not only as a stand-alone entity but also as a hybrid between a load and a generator. This is problematic because it makes energy storage less competitive to generating units and consumers, who pay the network charges only once.

Energy Storage Integration; Energy Storage Integration. Background and context. Energy storage has been part of the energy system for decades, but it is with the emergence of new storage technologies and the need to integrate more ...

TC/Energy Storage and sectoral integration/draft 12.01.2018 5 Source: Energies 2017, 10(4), 451, Power-to-Steel The Commission took first significant steps for positioning energy storage ...

The global battery energy storage system (BESS) integrator's senior director for strategy, market development and policy in Europe, the Middle East and Africa Julian Jansen and senior sales manager Rosa Milano ...

Energy Storage Systems (ESS) can play a significant role in more reliable, secure and flexible DN operation since they can deal with difficult-to-predict changes. This study provides a detailed methodology among the corresponding ...

This Friday briefing looks at the trend of long-duration energy storage (LDES) technology companies in project development, what role Europe's gigafactory projects play in the continent's energy storage system ...

Europe has seen its first year when energy storage deployments by power capacity exceeded 10GW in 2023. The eighth annual edition of the European Market Monitor on Energy Storage (EMMES) was published last ...

W&#228;rtsil&#228; Energy Storage & Optimisation. Energy storage integrator: optimising energy for a smarter, safer, more reliable grid. W&#228;rtsil&#228; Energy Storage & Optimisation is leading the ...

A solar PV system in Cyprus, funded by the European Bank for Reconstruction and Development (EBRD) which came online in 2017. Image: EBRD. Cyprus has set out a policy framework for the integration of energy ...
