

What does the European Commission say about energy storage?

The Commission adopted in March 2023 a list of recommendations to ensure greater deployment of energy storage, accompanied by a staff working document, providing an outlook of the EU's current regulatory, market, and financing framework for storage and identifies barriers, opportunities and best practices for its development and deployment.

Does energy storage contribute to the security of electricity supply in Europe?

Funded by the Commission, this independent study, entitled " Energy Storage Study - Contribution to the security of electricity supply in Europe ", analyses the different flexibility energy storage options that will be needed to reap the full potential of the large share of variable energy sources in the power system.

Why should EU countries consider the 'consumer-producer' role of energy storage?

It addresses the most important issues contributing to the broader deployment of energy storage. EU countries should consider the double 'consumer-producer' role of storage by applying the EU electricity regulatory framework and by removing barriers, including avoiding double taxation and facilitating smooth permitting procedures.

Why is energy storage important in the EU?

It can also facilitate the electrification of different economic sectors, notably buildings and transport. The main energy storage method in the EU is by far 'pumped hydro' storage, but battery storage projects are rising. A variety of new technologies to store energy are also rapidly developing and becoming increasingly market-competitive.

Is energy storage the key to decarbonising the EU energy system?

The Commission has published today a series of recommendations on energy storage, with concrete actions that EU countries can take to ensure its greater deployment. Analysis has shown that storage is key to decarbonising the EU energy system.

What is the main energy storage reservoir in the EU?

Amongst other findings, it shows how the main energy storage reservoir in the EU at the moment is pumped hydro storage. However, as prices fall, new battery technology projects are emerging - such as lithium-ion batteries and behind-the-meter storage.

Europe's industries are diverse, and so are its energy needs. But the common thread binding them is the need for sustainable, reliable, and cost-effective secure energy solutions, Julia Souder writes.

The Commission has published today a series of recommendations on energy storage, with concrete actions that EU countries can take to ensure its greater deployment. Analysis has shown that storage is key ...

The study delves into the specifics of the residential, C& I and utility-scale battery segments across the leading European markets, describing how regulatory frameworks and market conditions ...

The current European energy policy is based on the Energy Union ... the energy framework was extended to include rules for minimum gas storage filling levels of 90% ahead of winter ...

Although the impact of REPowerEU is therefore perhaps less immediately apparent than the IRA, a speech given this week by European Commission Vice President Maros Sefcovic highlighted that energy storage is ...

Innovative energy storage solutions will play an important role in ensuring the integration of renewable energy sources into the grid in the EU at the lowest cost, according to a new study published by the European ...

Excessive inventory posed a significant challenge for the European residential battery storage market in 2023. According to EESA statistics, new installations in Europe's residential battery storage sector ...
