

Ferromagnetic materials are a class of materials that exhibit strong magnetic properties due to the alignment of their internal magnetic moments. These materials possess permanent magnetic ...

ferromagnetic materials [8]. When ferromagnetism was unexpectedly observed in Ge, Mn, and Te, several studies were conducted on inorganic nonmetallic materials, and many ferromagnetic ...

Domain walls affect significantly ferroelectric and magnetic properties of magnetoelectric multiferroics. The stereotype is that the ferroelectric polarization will reduce at the domain walls due...

Ferromagnetism in 2D materials has attracted tremendous interest from the scientific community thanks to its potential for the design of magnetic materials with unique properties. The ...

Ferromagnetic materials are a class of materials that exhibit strong magnetic properties due to the alignment of their internal magnetic moments. These materials possess permanent magnetic moments that can spontaneously ...

@article{Yang2022AnEM, title={An extended magnetic-stress coupling model of ferromagnetic materials based on energy conservation law and its application in metal magnetic memory ...

Batteries are valued as devices that store chemical energy and convert it into electrical energy. Unfortunately, the standard description of electrochemistry does not explain specifically where ...

Double perovskites are promising for solar cells, thermoelectric generators, and renewable energy due to their stability, eco-friendly nature, lack of lead, and high performance. ...

Permanent magnets are made by magnetizing ferromagnetic material, a process that normally requires a substantial energy input. It is true that their magnetized state is a method for storing ...
