

Which fire protection solutions do you need for your energy storage system?

The relevant fire protection solutions for this application are the ones that are stand-alone, installed inside the Energy Storage System, are complete with detection and extinguishing, are resilient and have minimum maintenance requirements.

What is battery energy storage fire prevention & mitigation?

In 2019, EPRI began the Battery Energy Storage Fire Prevention and Mitigation - Phase I research project, convened a group of experts, and conducted a series of energy storage site surveys and industry workshops to identify critical research and development (R&D) needs regarding battery safety.

Why is it important to protect battery energy storage systems from fire?

Therefore, it is first of all necessary to protect the storage systems from an external fire event in order to prevent cell breakdown processes initiated due to external combustion heat. First and foremost, every lithium-ion battery energy storage poses an electrical fire risk.

Are large-scale battery energy storage systems preventing fires and explosions?

However, the rapid growth in large-scale battery energy storage systems (BESS) is occurring without adequate attention to preventing fires and explosions. That by the end of 2023, 10,000 megawatts (MW) of BESS will be energizing U.S. electric grids--10 times the cumulative capacity installed in 2019.

What are battery storage fire safety initiatives?

These initiatives have included creating a battery storage fire safety roadmap, developing recommendations and leading practices for designing systems, and training and working with first responders responsible for putting out fires.

How to protect a battery system from a fire?

Battery systems, modules and cells must be protected against external (electrical) fires. Possible measures: Fire alarm system with automatic extinguishing system for electrical risks. The extinguishing agent should ensure zero residue to the protection of the installation.
