How can a forklift with electric lifting device improve energy management?

We also proposed energy management strategy development of a forklift with electric lifting device to achieve a system that can be controlled easily with different speeds up and down, and at the same time, recover as much energy as possible in the downward movement and braking, which used supercapacitor as the energy storage system.

How does a forklift energy management strategy work?

Energy Management Strategy Once the battery is sized, its weight is added to the forklift and a new power requirement is calculated. This power needs to be shared into the battery (Pbat) and the supercapacitor (Psc).

Is a lithium-ion battery/supercapacitor hybrid energy storage system suitable for a forklift?

The suggested solution is well suited for forklifts which continuously start, stop, lift up and lower down heavy loads. This paper presents the sizing of a lithium-ion battery/supercapacitor hybrid energy storage system for a forklift vehicle, using the normalized Verein Deutscher Ingenieure (VDI) drive cycle.

How does a forklift lift system work?

The lifting system is controlled directly with an electric motor driveinstead of pump. First, we analyzed the working condition and energy flows of the forklift and proposed an energy recovery system for forklift. Second, we built the system model including supercapacitor model, vehicle model and the simulation model in AMESim.

What are the benefits of electric forklift?

The results show that the fuel consumption of the forklift with electric lifting device can be reduced by about 46.72% compared with the hydraulic forklift and its transmission efficiency is improved 82.3% when the loads is 3t. And its Energy savingis the most significant, as shown in Fig. 10, Fig. 12.

What are the energy flows in a forklift?

Analysis of the energy flows in Forklift There are many energy flows in the forklift, Fig. 2 depicts the energy flows from the power forklift toward the walking motor and the wheels through transmission system, which is one of the main flow of energy. The other is from power forklift toward lifting motor and ball screw device.

Proton exchange membrane (PEM) fuel cells are currently the most viable type used for powering industrial equipment such as forklifts. Similar to a battery, PEM fuel cells utilize a cathode, anode, and an electrolyte to ...
