

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why should we invest in energy storage technologies?

Investing in research and development for better energy storage technologies is essential to reduce our reliance on fossil fuels, reduce emissions, and create a more resilient energy system. Energy storage technologies will be crucial in building a safe energy future if the correct investments are made.

How can energy storage systems improve the lifespan and power output?

Enhancing the lifespan and power output of energy storage systems should be the main emphasis of research. The focus of current energy storage system trends is on enhancing current technologies to boost their effectiveness, lower prices, and expand their flexibility to various applications.

Could energy storage be the future of the grid?

Together, the model enhancements opened the door to exploring many new research questions about energy storage on the future grid. Across all modeled scenarios, NREL found diurnal storage deployment could range from 130 gigawatts to 680 gigawatts in 2050, which is enough to support renewable generation of 80% or higher.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Is diurnal storage the future of energy storage?

“We found energy storage is extremely competitive on an economic basis, and there are rapidly expanding opportunities for diurnal storage in the power sector,” said Will Frazier, lead author of Storage Futures Study: Economic Potential of Diurnal Storage in the U.S. Power Sector.
