Can GIS be used to identify suitable sites for pumped hydro energy storage?

Other studies have combined GIS analysis with multi-criteria decision making (MCDM) to identify suitable sites for pumped hydro energy storage (PHES) systems, both at the country scale, as well as for large areas and those exclusively located in natural environments exposing high elevation differences.

Are energy storage systems the key to a clean electricity grid?

In this context, energy storage systems (ESSs) are proving to be indispensable for facilitating the integration of renewable energy sources (RESs), are being widely deployed in both microgrids and bulk power systems, and thus will be the hallmark of the clean electrical grids of the future.

How many GWh of energy storage capacity are there?

After the exclusions are applied and upper and lower reservoirs are paired,only seven technical potential systems are found,totaling 13 GWhof energy storage capacity (Figure 13,page 4.21).

What types of energy storage technologies are available?

Wind turbines and solar photovoltaic (PV) collectors dominate new electricity capacity additions. Wind and solar PV are variable generators requiring storage to support large fractions of total generation. Pumped hydro energy storage is the largest, lowest cost, and most technically mature electrical storage technology.

Can a GIS-based approach be used to implement energy retrofitting strategies?

Through the use of a GIS-based approach, and overlying building data with environmental, economic and social data, it is possible to implement energy retrofitting strategies at a city level and to identify critical areas that require higher priority interventions. This section describes a case study of the city of Turin (Italy).

What are the limitations of energy models and tools?

Energy models and tools are currently available that use different approaches to simulate energy consumption at a territorial level, and their main limits concern the collection and availability of input data, their flexibility, the simulation times, and the accuracy of the simulations (Todeschi et al., 2021).
