

Global energy demand is rising steadily, increasing by about 1.6 % annually due to developing economies [1] is expected to reach 820 trillion kJ by 2040 [2]. Fossil fuels, including natural ...

1 ??&#0183; Azo-compounds molecules and phase change materials offer potential applications for sustainable energy systems through the storage and controllable release photochemical and ...

Phase change material (PCM)-based thermal energy storage significantly affects emerging applications, with recent advancements in enhancing heat capacity and cooling power. This perspective by Yang et al. ...

Among the different types of phase change materials, paraffin is known to be the most widely used type due to its advantages. However, paraffin's low thermal conductivity, its ...

The energy storage of negative gradient is greater than that of positive gradient, but the average rate of energy storage of the former is lower than that of the latter. ... The ...

Thermal storage is very relevant for technologies that make thermal use of solar energy, as well as energy savings in buildings. Phase change materials (PCMs) are positioned ...

The lag is in part due to economics, but in larger part is caused by technological barriers, which are widely identified [4], [8], [9] as (1) low PCM thermal conductivity and (2) ...

For instance, solar-driven phase-change heat storage materials and phase-change cool storage materials were applied to the hot/cold sides of thermoelectric systems to achieve solar-thermal ...

As an effective approach to deal with the intermittency and instability of energy, latent heat thermal energy storage (LHTES) with phase change materials (PCMs) has great ...

The method used by SHS in sequential charge-discharge of the storage system is gradient change in temperature of the material without changing its phase. ... Mar&#237;n JM, Cabeza LF, ...
