

Modeling different fleets of fuel-cell electric vehicles (FCEV), the authors find that the availability of large-scale storage can make hydrogen an important flexibility option in the ...

Despite hydrogen's high specific energy per unit mass, with 120 MJ/kg as the lower heating value (LHV), its low energy density per unit volume (about 10 MJ/m³) presents a challenge for achieving compact, cost-effective, ...

To minimize energy loss during storage, excellent insulation techniques are crucial. ... It is considered a potential solution for hydrogen energy storage and dispatchability as hydrogen gas has a large volume at ambient ...

The technology to convert power to hydrogen and back to power has a round-trip efficiency of 18%-46%, according to data that Flora presented from the Massachusetts Institute of Technology and scientific ...

Dihydrogen (H₂), commonly named "hydrogen", is increasingly recognised as a clean and reliable energy vector for decarbonisation and defossilisation by various sectors. The global hydrogen ...

We evaluate the energy efficiency and intensity of 25 direct and indirect uses of green hydrogen in 2019 for ground, air, and water transportation, including energy losses in ...

Thus, if it takes 45 kWh to produce 1 kg of green hydrogen and the energy loss is 30%, this 1 kg can later be used to generate around 30 kWh of electricity. Converting it to ammonia results in ...

However, its energy-to-volume ratio, exemplified by liquid hydrogen's 8.5 MJ.L⁻¹ versus gasoline's 32.6 MJ.L⁻¹, presents a challenge, requiring a larger volume for equivalent ...

However, system inefficiencies during hydrogen or e-fuel production, storage, transportation, dispensing, and use lead to approximately 80%-90% loss of the initial electrical ...
