

Which energy storage systems will be dominated by PHS in 2035?

Lithium-ion batteries have the largest cumulative power capacity (240.5 GW), accounting for 81.4% of electrochemical energy storage. Thirteen provinces will still be dominated by PHS in 2035. In contrast, the remaining 17 provinces could be dominated by other new types of energy storage under the BAU scenario, as shown in Fig. 6.

Which energy storage technologies reduce peak-to-Valley difference after peak-shaving and valley-filling?

The model aims to minimize the load peak-to-valley difference after peak-shaving and valley-filling. We consider six existing mainstream energy storage technologies: pumped hydro storage (PHS), compressed air energy storage (CAES), super-capacitors (SC), lithium-ion batteries, lead-acid batteries, and vanadium redox flow batteries (VRB).

Why are energy storage installations becoming more expensive?

This change is mainly due to a trade-off between power transmission and energy storage. Both of them are flexible resources to balance power fluctuations, and the increase in transmission costs will lead to more choices to equip energy storage installations.
