

Is hard carbon a viable material for SIB anode materials?

For SIB anode materials, hard carbon is the most mature and currently the only material likely to be commercialized, but it is still far away from large-scale industrialization. Herein, we carry out a comprehensive overview of the current state of the art in terms of three main aspects.

Is hard carbon a good anode material for lithium ion batteries?

Hard carbon (HC) is recognized as a promising anode material with outstanding electrochemical performance for alkali metal-ion batteries including lithium-ion batteries (LIBs), as well as their analogs sodium-ion batteries (SIBs) and potassium-ion batteries (PIBs).

Is coal-based hard carbon a good anode material for sodium-ion batteries?

In recent years, coal-based hard carbon has received widespread attention as an anode material for sodium-ion batteries [19,20]. To date, coal-based hard carbon is a promising anode material for sodium-ion batteries due to its high storage capacity, appropriately low operating potential and relatively stable source.

Are hard carbon anodes suitable for high-performance SIBs?

Hard carbon still suffers from unclear sodium storage mechanism, unsatisfactory performance, and low initial Coulombic efficiency (ICE). Herein, the current state-of-the-art advances in designing hard carbon anodes for high-performance SIBs is summarized.

Is hard carbon a good anode for Na-ion batteries?

Hard carbon (HC) is a promising anode candidate for Na-ion batteries (NIBs) because of its excellent Na-storage performance, abundance, and low cost. However, a precise understanding of its Na-storage behavior remains elusive.

Are there three types of sodium ion storage sites in the hard carbon anode?

This indicates the existence of three types of sodium ion storage sites in the hard carbon anode.
