

Hepu energy steam extraction energy storage

Who is Hepu Energy Environmental Technology Co?

Hepu Energy Environmental Technology Co initially focused on thermal power flexibility transformation and new energy consumption, and has made breakthroughs in thermal power unit flexibility transformation models.

How much energy does Hepu energy use a year?

The company uses 1.5 billion kwh of new energy annually, including wind and light resources in Northeast China, and has obtained more than 200 patents in the energy field. Founded in July 2016, Hepu Energy Group is a high-tech enterprise that focuses on energy storage, energy conservation, and environmental protection.

Can latent heat storage be used in industrial production of superheated steam?

Our study demonstrates the feasibility of using latent heat storage in the industrial production of superheated steam. Thermal energy is used for residential purposes, but also for processing steam and other production needs in industrial processes.

Can steam ejector improve waste heat recovery rate?

Zhang et al. studied a thermoelectric system with a 2 × 350 MW thermal power unit coupled with a steam ejector and used the main steam induced discharge steam to provide the heat source to improve the waste heat recovery rate by 8.66 %.

Can evaporative latent-heat storage save energy?

This storage system will not only provide system flexibility and fuel savings for this specific power plant system but, as the world's largest evaporative latent-heat storage system, it also shows that the feasibility of both upscaling, production of superheated steam and megawatt-scale heat transfer rates, as well as permitting a real system.

How does main steam and reheat steam affect tpse?

Main steam and reheat steam are the energy sources for the TES system and turbine power generation, so the extraction of different flow rates of main steam (EMS) and reheat steam (ERS) significantly impacts the heat storage and release processes of TPSE.

The innovation of this research is that the method of double storage tanks and double steam extraction decouples the boiler combustion load and turbine power generation ...

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including ...

2016, 182, ...

EMS Power Machines is a global power engineering company, one of the five world leaders in the industry in terms of installed equipment. The companies included in the company have been operating in the energy market ...

Although steam is widely used in industrial production, there is often an imbalance between steam supply and demand, which ultimately results in steam waste. To solve this problem, steam accumulators (SAs) can be used as ...

Thermal energy storage for direct steam generation concentrating solar power plants: Concept and materials selection Cristina ... ation, incorporating extraction and recuperation setups to ...

Thermal energy storage (TES) technology is a prevalent method for enhancing flexibility in CHP units. It facilitates the storage of surplus heat energy for subsequent release as required, a ...

Most solar power plants, irrespective of their scale (i.e., from smaller [12] to larger [13], [14] plants), are coupled with thermal energy storage (TES) systems that store ...

Due to increased share of fluctuating renewable energy sources in future decarbonized, electricity-driven energy systems, participating in the electricity markets yields the potential for industry to reduce its energy costs ...
