

Can a distributed inductor be used as energy storage unit?

The following conclusions can be drawn: When the distributed inductor of the transmission line is used as the energy storage unit, nanosecond pulses with high-voltage gain can be generated, whose pulse width is determined by the length of the transmission line.

What is high-voltage pulse generation circuit based on inductive energy storage?

High-voltage pulse generation circuit based on inductive energy storage with opening switch and transformer. In relation to the inductive storage circuits above, the faster is the open switch, the higher is the output voltage (Mankowski and Kristiansen 2000).

What is a multi-switch inductor energy storage forming line topology?

To solve this problem, in this paper, a new multi-switch inductor energy storage forming line topology is proposed, and the time-space transmission process of electromagnetic waves in the transmission line is regulated by double switches, so as to realize the modulation of output pulse width.

Why is inductor used as a secondary energy storage element?

It is mentioned in refs. [18 - 20] that the inductor is used as the secondary energy storage element to discharge pulses on the load through the cooperative action of the switch. The pulse amplitude obtained on the load will be higher than that on the primary energy storage unit so as to get a higher voltage gain.

What is a boost high-voltage nanosecond pulse generator?

In the article, a new type boost high-voltage nanosecond pulse generator is proposed. The distributed inductance of the transmission line is utilised as the energy storage unit and cooperated with the variable impedance transmission line transformer to generate nanosecond pulses with extremely high-voltage gain.

How to supply high voltage from low voltage DC power supplies?

Among others, to supply high voltage from low voltage dc power supplies, many researchers have been working on the realization of solid-state Marx generators with high voltage gains. Wu et al. developed a bipolar Marx generator based on double transformers. By using positive and negative outputs, Wu's generator can realize high gain.
