

How can cold energy be stored?

It has wide applications not only for air conditioning use in buildings, vehicles, and other conditioned spaces, but also for the fresh and frozen food storage and transport. In general, the cold energy can be stored in sensible, latent and sorption forms.

Do Rural houses save energy in cold regions?

Owing to poor design and technical constraints, the current energy-savings performance of rural houses in cold regions is low [7], and the construction of new rural houses in severe cold regions falls far short of the 65% energy-saving standard used in urban buildings.

What is seasonal thermal energy storage (STES)?

In the seasonal thermal energy storage (STES) technique, the available solar radiation in summer is harvested by solar thermal collectors and stored in large storage tanks or in the ground to be used during winter. The STES system is one of efficient systems for the heating application in building sector, especially in cold climate zones, .

Which thermal energy storage system is best for space heating?

The double U-tube borehole thermal energy storage (BTES) integrated with ground coupled heat pump (GCHP) and evacuated tube solar collector (ETSC) system was found to be most appropriate for space heating in cold climate zones.

What energy sources are used for rural homes in cold regions?

Common energy sources for rural houses in cold regions include coal, traditional biomass, natural gas, new biomass, electrical energy, solar energy, and wind energy. Traditional biomass has low combustion efficiency and results in high air pollution; natural gas represents clean energy and is the future trend of rural heating.

Can zero energy buildings be built in cold regions?

Experience and recommendations for zero energy building in cold regions is provided. Evaluation of actual zero energy buildings (ZEBs) performance and identification of its regional characteristics are of great significance for similar future projects.

Li et al. [7] reviewed the PCMs and sorption materials for sub-zero thermal energy storage applications from -114 °C to 0 °C. The authors categorized the PCMs into ...

Download Citation | On Feb 1, 2023, Fankang Meng and others published Heat storage and release performance experiment of externally hung phase change solar greenhouse in severe ...

The cold thermal energy storage (TES), also called cold storage, are primarily involving adding cold energy to

a storage medium, and removing it from that medium for use at a later time. It can efficiently utilize the ...

We present more than one-year of monitoring results from a thermal energy storage system located in a very cold place with a long winter season. The studied house is in ...

Evaluation of actual zero energy buildings (ZEBs) performance and identification of its regional characteristics are of great significance for similar future projects. Based on ...

The core function of rural housing is to provide a home for rural residents. An efficient spatial layout guarantees the functionality of the buildings and reduces energy ...

In this paper, we proposed a design framework for low-energy rural houses in severe cold regions, including the spatial layout, building type, enclosure system, and energy ...

Despite existing restrictions, cold-climate regions represent a beneficial environment for solar energy systems. PV modules are easy to install and operate, have no moving parts, and perform particularly well in cold ...

DOI: 10.21079/11681/42200 Corpus ID: 244227174; Installation resilience in cold regions using energy storage systems @inproceedings{Callaghan2021InstallationRI, title={Installation ...

The energy consumption of greenhouses in cold regions, especially for space heating, is immense and therefore economically unbearable. The main objective of this article is to provide a ...
