

How do I connect a power supply to a hard drive?

Connect the power supply to the hard drive. Most newer power supplies have SATA power connectors, though older power supplies typically only have Molex (4 pin) connectors. If this is the case, and you are installing a SATA drive, you will need a Molex-to-SATA adapter. Ensure that none of the cables can come undone by wiggling them a little bit.

How do you connect a hard drive to a computer?

Secure the drive into the drive bay by inserting two screws into each side of the hard drive through the corresponding holes in the drive bay. Make sure to only use short screws designed for hard drives; if the screws are too long they could seriously damage the hard drive when it is running. Connect the SATA cables to the hard drive.

How do I connect my optical drive to a power supply?

Connect the power supply to the optical drive. Use the SATA power connector to plug into the larger SATA slot on your optical drive. The cable can only be inserted in one direction, so don't force it. If your power supply is older, it may only have Molex (4-pin) connectors. If this is the case, you will need to use a Molex-to-SATA adapter.

How do you connect a hard drive to a motherboard?

Newer hard drives will use SATA cables, which are thin and resemble USB cables. Use a SATA cable to connect the hard drive to the motherboard. SATA cables can be connected in either direction. If you are connecting your primary hard drive, the SATA cable should be plugged into the first SATA channel. Make sure that you're using a Windows computer.

How do I connect a SATA hard drive?

Connect the SATA cable to the hard drive. Connect the insulated power cable with the wider tip into the larger connection port situated on the left-rear of the HDD. If the power cable does not fit easily, check to make sure that it is not upside down. Connect the data cable to the smaller SATA port on the hard drive.

How do you secure a hard drive?

Secure the hard drive. Once the hard drive has been inserted, use the screws that came with it to secure the hard drive in the drive cage. Ideally, you should use two screws on each side of the hard drive. If the hard drive is loose, it can rattle and cause more noise and lead to physical damage.
