

Can laser-induced graphene be used in energy storage devices?

The latest advances of laser-induced graphene (LIG) in energy storage devices are fully discussed. The preparation and excellent properties of LIG applied in different devices are reviewed. The research methods of further modification of LIG properties are summarized.

How can laser power be used in industrial applications?

Arrays of beams with individual control of polarization, intensity profile and front tilt can speed up fabrication and more efficiently use laser power in industrial applications [183]. This mini-review of the state of the art and emerging applications shows the maturity of the ~ 20-year-old field.

Can a laser drying process save energy?

When battery electrodes are dried, a laser process opens up a large potential for energy savings since its energy input is far more efficient than that of conventional drying in a continuous furnace.

Are LIG materials a good energy storage material?

In summary, LIG materials have unique advantages as energy storage material that will be actively developed and commercialized in the long term. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Are ultrafast lasers a good choice for industrial customers?

To make these lasers more robust turnkey tools for industrial customers, the main challenge remains the cost of ownership, as the ultrafast laser market is very elastic. Price goes down and volume goes up.

How do laser parameters affect the formation of functionalized nanostructures?

The effects of laser parameters, such as laser fluency (time duration, pulse width, wavelength, and repetition rate), focusing parameters (target position and focal length), and the liquid medium (type of solvent, plasma plume) on the formation of diverse functionalized nanostructures are discussed.

[62, 63] The 3DP-MAX laser electrodes are evaluated for energy storage application, and we found an excellent result for cyclic stability for 100 000 cycles, which is not reported until now for MAX phase, in this regard ...

Applications include energy storage (batteries), energy conversion (solar), biology, environment and nuclear security. Our research focuses on the development of real-time spectroscopy tools based on the interaction of high ...

Processing of materials by ultrashort laser pulses has evolved significantly over the last decade and is starting

to reveal its scientific, technological and industrial potential. In ...

As an advanced metal additive manufacturing technology, laser-directed energy deposition (DED-LB) has attracted a lot of attention in recent years, and is increasingly used in ...

Explore our in-depth industry research on 1300+ energy storage startups & scaleups and get data-driven insights into technology-based solutions in our Energy Storage Innovation Map! ... and also scale it up to power large ...

In ultrafast laser manufacturing, optical energy of tightly focused femtosecond or picosecond laser pulses can be delivered to precisely defined positions in the bulk of materials ...

To introduce competitive energy storage systems into the mass market, industry needs to reduce the production costs for battery cells significantly. One cost driver here is the energy-intensive manufacturing process. A promising approach to ...

first conducted laser ablation on the PI film using a commercial CO₂ laser source, resulting in the fabrication of laser-induced graphene (LIG).[28] After that, it has been found that LIG can be ...

Mxenes gained significant interest as a highly promising contender for energy storage applications, particularly in the area of supercapacitors (SCs) [119]. In contrast to the compact ...

Based on these advantages, Tour group first conducted laser ablation on the PI film using a commercial CO₂ laser source, resulting in the fabrication of laser-induced ...

With the advent of 10 kW ultrafast lasers, and even 20 kW on the horizon, potential applications are expected in areas like large surface functionalization or parallel processing, secondary sources generation of EUV or XUV, new data ...

Theoretically, laser results from stimulated radiation. In particular, an incident photon will cause the decay of an excited electron of a material to the ground state if they ...

Energy is essential in our daily lives to increase human development, which leads to economic growth and productivity. In recent national development plans and policies, numerous nations ...

The overall contents of laser-induced graphene (LIG) are discussed in this review, especially focusing on the several parameters for synthesizing LIG and their effects, and applications in electroche...
