

What are sensible and latent thermal energy storage?

Sensible, latent, and thermochemical energy storages for different temperatures ranges are investigated with a current special focus on sensible and latent thermal energy storages. Thermochemical heat storage is a technology under development with potentially high-energy densities.

What is thermal energy storage?

Provided by the Springer Nature SharedIt content-sharing initiative Thermal energy storage offers enormous potential for a wide range of energy technologies. Phase-change materials offer state-of-the-art thermal storage due to high latent heat.

What is thermochemical heat storage?

Thermochemical heat storage is a technology under development with potentially high-energy densities. The binding energy of a working pair, for example, a hydrating salt and water, is used for thermal energy storage in different variants (liquid/solid, open/closed) with strong technological links to adsorption and absorption chillers.

What is a typical storage temperature?

Each application requires different storage temperatures. While for buildings the typical temperature range is between 5 and 90 °C, for industries with process heat applications it is typically between 40 and 250 °C and for solar thermal power plants up to 600 °C.

What are the challenges of latent thermal energy storage?

One of the main challenges for latent thermal energy storages is the phase change itself which requires a separation of the storage medium and HTF. Furthermore, PCMs usually have a low thermal conductivity, which limits the heat transfer and power of the storage.

Which components are developed for latent thermal energy storage systems?

Furthermore, components for latent thermal energy storage systems are developed including macroencapsulated PCM and immersed heat exchanger configurations. For material development the following key points can be concluded.

The capacitive energy-storage capacity of most emerging devices rapidly diminishes with increasing temperature, making high-temperature dielectrics particularly desirable in modern electronic systems.
