

What is dynamic frequency modulation model?

The dynamic frequency modulation model of the whole regional power grid is composed of thermal power units, energy storage systems, nonlinear frequency difference signal decomposition, fire-storage cooperative fuzzy control power distribution, energy storage system output control and other components.

What is the mathematical model of the energy storage system?

The mathematical model of the specific control strategy of the energy storage system is as follows: (10) $DP_{fref} = -K_F Df/H$ (11) $DP_{bref} = -K_B Df/L$ 1. 1) $Df \leq 0.033 \text{ Hz}$, the energy storage system does not participate in primary frequency modulation. 2. 2) $Df < -0.033 \text{ Hz}$ and $SOC \geq 0.4$, the actual output power value of energy storage is:

What are the power instructions for the energy storage system?

The power instructions for the energy storage system to participate in the frequency modulation of thermal power units are as follows: 1) When $Df \leq 0.033 \text{ Hz}$, the energy storage system is in a locked state and does not participate in frequency modulation. (19) $P=0$

Which control scheme is adopted in hybrid energy storage combined thermal power units?

In summary, control scheme D is adopted when hybrid energy storage combined thermal power units are configured to participate in frequency modulation, namely, both flywheel energy storage and lithium battery energy storage adopt an adaptive variable coefficient control strategy to achieve the best effect.
