Should lithium processing facilities be built outside China?

The local content requirements and foreign entity of concern restriction in the Clean Vehicle Tax Credit of the US Inflation Reduction Act incentivize the construction of lithium processing facilities outside of China.

Which countries have the most economically viable lithium resources?

These three countries, together with Argentina, hold most of the economically viable reserves. The concentration, or grade, of the lithium resource is a strong determinant of economic viability. Other countries, such as Bolivia, possess lithium resources that are currently considered uneconomical.

Why is lithium a determinant of economic viability?

The concentration, or grade, of the lithium resource is a strong determinant of economic viability. Other countries, such as Bolivia, possess lithium resources that are currently considered uneconomical. The limited geographical distribution of lithium production tightens the market despite the metal's abundance in the earth's crust.

Are batteries and hydrogen the future of energy storage?

Historically, the most widely used technology for energy storage worldwide has been pumped hydropower. But with costs on a downward trend, batteries and hydrogen are currently in the spotlight. In Europe, installed battery storage capacity is projected to grow nearly sixfold in the next decade.

What happens if a lithium grade is low?

Lower lithium grades lead to more mining, waste, and processing per ton. Lithium is found predominantly in salt brines (salars) or hard rock deposits. Brines can be directly processed into lithium carbonate, suited for cheaper but less energy-dense cathodes.
