

What are lithium-ion batteries used for?

Not only are lithium-ion batteries widely used for consumer electronics and electric vehicles, but they also account for over 80% of the more than 190 gigawatt-hours (GWh) of battery energy storage deployed globally through 2023.

How do lithium ion batteries work?

Li-ion batteries typically use ether (a class of organic compounds) as an electrolyte. Lithium ions are stored within graphite anodes through a mechanism known as intercalation, in which the ions are physically inserted between the 2D layers of graphene that make up bulk graphite.

How much energy does it take to make a lithium ion battery?

Manufacturing a kg of Li-ion battery takes about 67 megajoule (MJ) of energy. The global warming potential of lithium-ion batteries manufacturing strongly depends on the energy source used in mining and manufacturing operations, and is difficult to estimate, but one 2019 study estimated 73 kg CO<sub>2</sub>e/kWh.

Why do lithium ion batteries need to be charged?

Simply storing lithium-ion batteries in the charged state also reduces their capacity (the amount of cyclable Li<sup>+</sup>) and increases the cell resistance (primarily due to the continuous growth of the solid electrolyte interface on the anode).

What is a lithium ion battery?

Lithium-ion cells can be manufactured to optimize energy or power density. Handheld electronics mostly use lithium polymer batteries (with a polymer gel as an electrolyte), a lithium cobalt oxide (LiCoO<sub>2</sub> or NMC) may offer longer life and a higher discharge rate.

How long does a lithium ion battery take to charge?

Typically, the charge is terminated at 3% of the initial charge current. In the past, lithium-ion batteries could not be fast-charged and needed at least two hours to fully charge. Current-generation cells can be fully charged in 45 minutes or less.
