

What are the different methods of thermal energy storage?

The article presents different methods of thermal energy storage including sensible heat storage, latent heat storage and thermochemical energy storage, focusing mainly on phase change materials (PCMs) as a form of suitable solution for energy utilisation to fill the gap between demand and supply to improve the energy efficiency of a system.

Are cold thermal energy storage systems suitable for sub-zero temperatures?

Overall, the current review paper summarizes the up-to-date research and industrial efforts in the development of cold thermal energy storage technology and compiles in a single document various available materials, numerical and experimental works, and existing applications of cold thermal energy storage systems designed for sub-zero temperatures.

How to choose a suitable thermal energy storage material?

The selection of a suitable thermal energy storage material is the foremost step in CTES design. The materials that can be used for cold storage applications are mainly sensible thermal energy storage materials and PCMs.

Are liquid sensible thermal energy storage materials suitable for sub-zero temperatures?

Existing and potential sensible solid thermal energy storage materials for sub-zero temperatures. Liquid sensible thermal energy storage materials can act as both the thermal energy storage material and the HTF at the same time in a CTES system, which is different from the solid sensible materials.

What are sensible and latent thermal energy storage?

Sensible, latent, and thermochemical energy storages for different temperatures ranges are investigated with a current special focus on sensible and latent thermal energy storages. Thermochemical heat storage is a technology under development with potentially high-energy densities.
