## Metal antimony energy storage mechanism

Are lithium-antimony-lead batteries suitable for stationary energy storage applications? However,the barrier to widespread adoption of batteries is their high cost. Here we describe a lithium-antimony-lead liquid metal battery that potentially meets the performance specifications for stationary energy storage applications.

Can a low-melting-point antimony-bismuth-tin positive electrode achieve high energy density? Achieving a high energy density still remains a big challenge. Herein, we report a low-melting-point antimony-bismuth-tin positive electrode for LMB with high energy density and excellent rate performance for the first time. The electromotive force of Li||Sb-Bi-Sn system is determined by Li||Sb and Li||Bi chemistries.

Does alloying a high-melting-point metal reduce the operating temperature?

Our results demonstrate that alloying a high-melting-point, high-voltage metal (antimony) with a low-melting-point, low-cost metal (lead) advantageously decreases the operating temperature while maintaining a high cell voltage.

Is stibium a suitable anode material for aqueous alkaline batteries (AABS)?

Stibium (Sb) metal is a novel and promising anode material for aqueous alkaline batteries (AABs) due to its highly reversible redox reaction and low standard redox potential in alkaline solution (-0.66 V vs Hg/HgO).

The development of sodium-ion (SIBs) and potassium-ion batteries (PIBs) has increased rapidly because of the abundant resources and cost-effectiveness of Na and K. Antimony (Sb) plays an important role in SIBs ...
