

Can mobile energy storage systems improve resilience of distribution systems?

According to the motivation in Section 1.1, the mobile energy storage system as an important flexible resource, cooperates with distributed generations, interconnection lines, reactive compensation equipment and repair teams to optimize dispatching to improve the resilience of distribution systems in this paper.

What is a mobile energy storage system (mess)?

During emergencies via a shift in the produced energy, mobile energy storage systems (MESSs) can store excess energy on an island, and then use it in another location without sufficient energy supply and at another time, which provides high flexibility for distribution system operators to make disaster recovery decisions.

What is mobile energy storage?

Based on this, mobile energy storage is one of the most prominent solutions recently considered by the scientific and engineering communities to address the challenges of distribution systems.

How can mobile energy storage and microgrids improve distribution system resilience?

Enhancing distribution system resilience with mobile energy storage and microgrids Optimal V2G and route scheduling of mobile energy storage devices using a linear transit model to reduce electricity and transportation energy losses Mobile emergency generator pre-positioning and real-time allocation for resilient response to natural disasters

Does a mobile energy storage system meet transportation time requirements?

Moreover, from the simulation results shown in Fig. 6 (h) and (i), the movement of the mobile energy storage system between different charging station nodes meets the transportation time requirements, which verifies the effectiveness of the MESS's spatial-temporal movement model proposed in this paper.

Do mobile energy storage systems have a bilevel optimization model?

Therefore, mobile energy storage systems with adequate spatial-temporal flexibility are added, and work in coordination with resources in an active distribution network and repair teams to establish a bilevel optimization model.
