Do mobile energy storage systems have a bilevel optimization model?

Therefore, mobile energy storage systems with adequate spatial-temporal flexibility are added, and work in coordination with resources in an active distribution network and repair teams to establish a bilevel optimization model.

What is the optimal scheduling model of mobile energy storage systems?

The optimal scheduling model of mobile energy storage systems is established. Mobile energy storage systems work coordination with other resources. Regulation and control methods of resources generate a bilevel optimization model. Resilience of distribution network is enhanced through bilevel optimization.

Does a mobile energy storage system meet transportation time requirements?

Moreover, from the simulation results shown in Fig. 6 (h) and (i), the movement of the mobile energy storage system between different charging station nodes meets the transportation time requirements, which verifies the effectiveness of the MESS's spatial-temporal movement model proposed in this paper.

What are the development directions for mobile energy storage technologies?

Development directions in mobile energy storage technologies are envisioned. Carbon neutrality calls for renewable energies, and the efficient use of renewable energies requires energy storage mediums that enable the storage of excess energy and reuse after spatiotemporal reallocation.

How do mobile energy storage systems work?

Mobile energy storage systems work coordination with other resources. Regulation and control methods of resources generate a bilevel optimization model. Resilience of distribution network is enhanced through bilevel optimization. Optimized solutions can reduce load loss and voltage offset of distribution network.

How do different resource types affect mobile energy storage systems?

When different resource types are applied, the routing and scheduling of mobile energy storage systems change. (2) The scheduling strategies of various flexible resources and repair teams can reduce the voltage offset of power supply buses under to minimize load curtailment of the power distribution system.
