

Can nanomaterials improve the performance of energy storage devices?

The development of nanomaterials and their related processing into electrodes and devices can improve the performance and/or development of the existing energy storage systems. We provide a perspective on recent progress in the application of nanomaterials in energy storage devices, such as supercapacitors and batteries.

How does nanostructuring affect energy storage?

This review takes a holistic approach to energy storage, considering battery materials that exhibit bulk redox reactions and supercapacitor materials that store charge owing to the surface processes together, because nanostructuring often leads to erasing boundaries between these two energy storage solutions.

What are the different types of energy storage technologies?

Energy storage enables electricity production at one time to be stored and used later to meet peak demand. The document then summarizes different types of energy storage technologies including batteries, mechanical storage, compressed air, pumped hydro, hydrogen, and flywheels.

What are the limitations of nanomaterials in energy storage devices?

The limitations of nanomaterials in energy storage devices are related to their high surface area--which causes parasitic reactions with the electrolyte, especially during the first cycle, known as the first cycle irreversibility--as well as their agglomeration.

Which nanomaterials are used in energy storage?

Although the number of studies of various phenomena related to the performance of nanomaterials in energy storage is increasing year by year, only a few of them--such as graphene sheets, carbon nanotubes (CNTs), carbon black, and silicon nanoparticles--are currently used in commercial devices, primarily as additives (18).

How can nanomaterials prevent polysulfide shuttle?

The same materials with nanofiber or nanosheet morphology can be used for coating separators to prevent polysulfide shuttle. Another type of nanomaterial in the form of 0D or 2D particles or porous scaffolds can be used to prevent Li dendrite growth on the anode side (98,99).
