

How can NREL improve the production of solid-state batteries?

To streamline the future deployment of solid-state batteries, NREL researchers are evaluating high-throughput techniques to optimize cell fabrication, such as roll-to-roll manufacturing. The current high-pressure, high-temperature batch processing used to create solid-state batteries is not suitable for large-scale manufacturing.

Could new redox flow battery designs enable market deployment?

NREL researchers are engineering new redox flow battery designs that may enable market deployment of this emerging technology. One design, a scalable flow loop system, is compatible with both aqueous and organic chemistries, which allows researchers to explore compatibility with novel materials to maximize high-power performance.

Are solid-state battery cells a viable solution for low-cost deployment?

The interface stability of solid-state battery cells is critical to enable low-cost deployment in electric vehicles and grid applications. To streamline the future deployment of solid-state batteries, NREL researchers are evaluating high-throughput techniques to optimize cell fabrication, such as roll-to-roll manufacturing.

Why are stationary battery energy storage systems important?

The growing popularity of electric vehicles requires greater energy and power requirements--including extreme-fast charge capabilities --from the batteries that drive them. In addition, stationary battery energy storage systems are critical to ensuring that power from renewable energy sources is available when and where it is needed.

In particular, their superior electrochemical activity and ease-of-modification make CDs very promising electrode materials in electrocatalysis and electrical energy storage. ...

Electrochemical Energy Storage is the missing link for 100% renewable electricity and for making transportation carbon-free. Lithium ion batteries (LIBs) dominate these markets, and we are working on developing better anode, cathode, and ...

Our lab is working closely with them through Argonne National Laboratory to develop an electrochemical steel production process that could supplant current production ...

2 Electrochemical Energy Storage Technologies Electrochemical storage systems use a series of reversible chemical reactions to store electricity in the form of chemical energy. Batteries are ...

designing materials and electrolytes for energy We study complex phenomena in solids and liquids and at their

electrified interfaces. We apply the fundamental knowledge that we gained to developing new energy systems that can deliver ...

The Advanced Electrolyte Research Group seeks to develop new organic materials for next-generation electrochemical energy storage, such as electrolyte solvents, lithium salts, SEI formation additives, redox-active organic ...

Supported largely by DOE's OE Energy Storage Program, PNNL researchers are developing novel materials in not only flow batteries, but sodium, zinc, lead-acid, and flywheel storage systems that are boosting performance, safety, and ...

High entropy materials (HEMs) with a single-phase structure have introduced a brand-new area of research in electrochemical energy conversion and storage devices. The fusion of divergent ...

A massive challenge of 21st century will be the development of efficient and sustainable means of energy conversion, distribution and storage. Electrochemical energy storage and conversion will play a key role in any ...

Cost-effective and high-performance electrochemical energy storage devices can increase the fuel efficiency of new transportation technologies, including start-stop vehicle, (plug-in) hybrid ...

“By combining a data-driven method and our research experience, we created a carbon material with enhanced physicochemical and electrochemical properties that pushed the boundary of energy storage ...

The Columbia Electrochemical Energy Center (CEEC) is part of a team led by Argonne National Laboratory (ANL) that has won a five-year \$62.5 million grant from the U.S. Department of ...

NREL is researching advanced electrochemical energy storage systems, including redox flow batteries and solid-state batteries. The clean energy transition is demanding more from electrochemical energy storage systems ...

The U.S. Department of Energy has selected Argonne National Laboratory to spearhead the Energy Storage Research Alliance (ESRA), one of two new Energy Innovation Hubs. This energy innovation hub unites top ...
