

Can a new sail device increase propulsive forces?

Japanese company Eco Marine Power has unveiled a new sail device that can be used as a modification for rigid sails or used as a stand-alone energy-saving device. As disclosed, this sail device known as a Saillet (patent pending) can increase the propulsive forces created by EMP's patented EnergySail.

What is the EnergySail (patent pending)?

The EnergySail (patent pending) has been designed by Eco Marine Power and is unlike any other sail- it can be used even when a ship is at anchor or in port and has been designed to withstand high winds or sudden micro-bursts. The EnergySail can also be fitted with a range of renewable energy technologies such as solar panels or wind power devices.

What is the EnergySail?

The EnergySail is an ideal wind assisted or sail assisted propulsion solution. A variation of the EnergySail that is suitable for Unmanned Surface Vessels (USV's) and smaller ships such as passenger ferries or fishing vessels is also being developed. The EnergySail can be configured to suit the operational profile of a vessel.

Can new energy sources be integrated into traditional ship power systems?

The integration of new energy sources into traditional ship power systems has enormous potential to bring the shipping industry in line with international regulatory requirements and is set to become a key focus of ship-related researches in the immediate future.

How can a multi-source energy system improve ship power generation?

Using a multi-source energy system allows to optimize and improve ship power generation. While the combination of alternative energy sources increases the capital expenditures, thanks to the ability to reach higher efficiencies the operational expenditures decrease. Fig. 1.

Is solar energy a good option for a ship?

Solar energy is beneficial considering the auxiliary power demand of the ship, but considering the driving system, the output power is very limited because it is directly related to the available surface where the PV can be implemented and a low power level by the square meter (a few hundred W/m<sup>2</sup>).
