What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective solution for balancing this mismatch and therefore is suitable for use in future electrical systems to achieve a high penetration of renewable energy generation.

Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [1]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air.

What is advanced adiabatic compressed air energy storage?

In current CAES technology, the compressed air used to create electricity is supplemented with a small amount of natural gas or other fuel. A different type of CAES that aims to eliminate the need of fuel combustion, known as Advanced Adiabatic Compressed Air Energy Storage (AA-CAES), has recently been developed.

How many kW can a compressed air energy storage system produce?

CAES systems are categorised into large-scale compressed air energy storage systems and small-scale CAES. The large-scale is capable of producing more than 100MW, while the small-scale only produce less than 10 kW. The small-scale produces energy between 10 kW - 100MW.

How many large scale compressed air energy storage facilities are there?

As of late 2012, there are three existing large scale compressed air energy storage facilities worldwide. All three current CAES projects use large underground salt caverns to store energy. The first is located in Huntorf, Germany, and was completed in 1978.

What are the stages of a compressed air energy storage system?

There are several compression and expansion stages: from the charging, to the discharging phases of the storage system. Research has shown that isentropic efficiency for compressors as well as expanders are key determinants of the overall characteristics and efficiency of compressed air energy storage systems.

At the company's first fully computer-controlled plant, he acted as design technical engineer, program developer and on-site start-up engineer. He was later involved with control schemes for large air separation plant, and worked to ...
