How do nanoscale polymers affect energy storage performance?

As the size of fillers or thickness of introduced dielectric layers in the polymer matrix reduce to the nanoscale, the volume fraction of the nano-sized interfacial regions remarkably increases, becoming comparable to that of inorganic components, thus essentially influencing the overall energy storage performance.

Is energy storage a new technology?

Energy storage is not a new technology. The earliest gravity-based pumped storage system was developed in Switzerland in 1907 and has since been widely applied globally. However, from an industry perspective, energy storage is still in its early stages of development.
