

What is energy storage?

Energy storage, as a "buffer" between the uncertainty of power generation and the disorder of load use in the Energy Internet, is its key supporting technology. Unlike the large-scale centralized energy storage on the power supply side and the grid side, distributed energy storage is usually installed on the user side or in the microgrid.

How to plan the energy storage system on the user side?

For the planning of the energy storage system on the user side, the main problems are: Li D et al. [ 9] consider the annual comprehensive cost of installing the energy storage system and the daily electricity charge of users and establish a two-level optimization model.

When should a small energy storage device be submitted to a platform?

User-side small energy storage devices as well as the power grid need to be submitted to the platform before the day supply/demand power information. The platform side needs to sort out the total supply of power and total demand power information for each time period and release the information.

How does energy storage work?

In this case, the energy storage side connects the source and load ends, which needs to fully meet the demand for output storage on the power side and provide enough electricity to the load side, so a large enough energy storage capacity configuration is a must.

What is a user-side small energy storage device?

With the new round of power system reform, energy storage, as a part of power system frequency regulation and peaking, is an indispensable part of the reform. Among them, user-side small energy storage devices have the advantages of small size, flexible use and convenient application, but present decentralized characteristics in space.
