

Can compressed air energy storage be combined with pressurized water thermal energy storage?

This paper presents a hybrid system integrating compressed air energy storage (CAES) with pressurized water thermal energy storage (PWTES). The open type isothermal compressed air energy storage (OI-CAES) device is applied to the CAES subsystem to achieve near-isothermal compression of air.

Can a cogeneration system use pressurized water as a heat storage medium?

A cogeneration system using pressurized water as a heat storage medium is proposed. The open type isothermal compressed air energy storage is applied in the system. The thermodynamic model and the transient mathematical model are developed. The sensitivity of design parameters and thermodynamic parameters are assessed.

How does pressurization improve the heat storage capacity of liquid water?

Meanwhile, the heat storage capacity of liquid water is improved by pressurization in the PWTES subsystem. Electricity is converted directly to heat through joule-resistive heating to improve the temperature of pressurized water.

What is a hybrid energy storage system combining CAEs and pwtes?

To fill this gap, a hybrid energy storage system combining CAES and pressurized water thermal energy storage (PWTES) is proposed. In this system, the OI-CAES is applied for the first time in a complete CAES subsystem, where it serves as an isothermal compressor.

What is energy storage?

Energy storage is a vast field of study that encompasses thermal, electrical, chemical, and mechanical energy storage technologies [20, , , ]. The technologies differ immensely in their usage and there is no single system that can be employed universally. The selection of the storage system depends on the application.

Is water a good option for thermal energy storage?

Water provides a lucrative option for thermal energy storage due to its high specific heat capacity. However, its use is restricted to a temperature range of 0 - 100 °C. For higher temperatures, thermal oils can be used up to 400 °C but they need to be pressurized which adds to the cost of running [47].
