Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promisingfor thermal energy storage applications. However,the relatively low thermal conductivity of the majority of promising PCMs (<10 W/(m ? K)) limits the power density and overall storage efficiency.

How does PCM encapsulation affect energy storage capacity of nanoconfined phase change materials? Because latent heat storage determined by the PCM encapsulated in the composite, a high content of supporting materials can reduce the PCM encapsulation efficiency and significantly influences the energy storage capacity of nanoconfined phase change materials ,.

Should biochar-based phase change composites be used in latent heat thermal energy storage? In addition, the utilization of biochar-based phase change composites in latent heat thermal energy storage can minimize the burden related to the cost and manufacturability of nanomaterials, which are crucial factors even for battery technologies. In phase change composite development, it is difficult to select a specific material.

Are graphene-aerogel-based phase change composites suitable for thermal storage applications?

The improved thermal conductivity and phase change enthalpy (which corresponds to energy density) are the two important parameters that make the graphene-aerogel-based phase change composites an attractive materials for thermal storage applications.

What is phase change energy storage wood (pcesw)?

Wang et.al., prepared a phase change energy storage wood (PCESW) by incorporating microPCM into balsa wood using vacuum impregnation method. Balsa wood has low density and high porosity, its porosity is further improved by delignification using a solution consisting of sodium hydroxide and sodium sulphite.
