

What is Qatar energy's strategy?

It relies on several main pillars: to develop a low carbon energy department, to reduce emissions to compensate for residual emissions, and to preserve the company's leading position in the LNG sector. Qatar Energy set within its strategy several targets, such as:

Can Qatar be part of the energy transition?

Qatar's existing infrastructure and history provide opportunity to be part of that energy transition. Technically, Qatar produces natural gas at a low cost and can produce cheap hydrogen using commercial technologies. To deal with the emissions, CCUS options and renewable energy can be integrated to lower the emissions.

How can Qatar achieve energy security?

To achieve this, Qatar should invest in system analysis methods development and create knowledge for its own future. Priorities of current natural gas clients are in achieving energy security, with it comes diversification of suppliers to lower costs and elevate supply chain instabilities.

What is Qatar's energy system?

Qatar has a unique energy system. The country's infrastructure is geared towards producing and exporting large volumes of natural gas, either directly (in a gaseous or liquefied state), or conversion to liquid fuels (gas-to-liquids) and petrochemicals.

Why does Qatar use natural gas?

Fortunately for Qatar, natural gas is the cleanest form of fossil fuels and is classified as an energy transition fuel, used to shift away from coal and other forms of carbon intensive fuels. Moreover, natural gas is often used to backup renewable energy systems to overcome intermittent production and seasonality issues.

How to increase the share of electricity supply in Qatar?

Qatar's electricity, water, and cooling demands for 2019 are used as input in this study. The CSP with storage can increase the share of electricity supply by RES to 38.2%. Pump hydro and electro-fuels storage are the best alternatives to enhance the storage capacities of RES.
