

Does a shared energy storage system reduce the cost of energy storage?

The results show that the construction of a shared energy storage system in multi-microgrids has significantly reduced the cost and configuration capacity and rated power of individual energy storage systems in each microgrid.

What is the optimal shared energy storage capacity?

The optimal shared energy storage capacity was determined to be 4065.2 kW h, and the optimal rated power for shared energy storage charging and discharging was 372 kW. Table 2. Capacity configuration results of PV and wind turbine in each microgrid

What is community shared energy storage (CSES)?

Community shared energy storage (CSES) is a solution to alleviate the uncertainty of renewable resources by aggregating excess energy during appropriate periods and discharging it when renewable generation is low. CSES involves multiple consumers or producers sharing an energy storage system.

How many kW h is a shared energy storage system?

For the individually configured energy storage systems, the total capacity is $698.25 + 1468.7613 + 2580.4475 = 4747.4588$ kW h, while the optimal shared energy storage capacity configuration is 4258.5857 kW h, resulting in further reduction.

Are shared energy resources better than private energy storage?

We demonstrate the advantages of using shared as opposed to private energy storage. Distributed Energy Resources have been playing an increasingly important role in smart grids. Distributed Energy Resources consist primarily of energy generation and storage systems utilized by individual households or shared among them as a community.

Can community members use a shared energy storage system?

To use the shared energy storage system, community members can lease the capacity of the CSES. In other words, the maximum purchased power from or sold power to the shared storage is limited by the leased capacity. The leased capacity represents the share of the CSES' capacity that each consumer can use.
