

What are solar-driven integrated energy storage devices?

On a basis of solar charging mechanism, the solar-driven integrated energy storage devices encompass two main categories of discrete connection (PV module charging) and direct incorporation (photoelectrode charging). Specifically, the discrete connection can be further subdivided into external wire and shared electrode hybridization.

How do solar cells and energy storage systems work?

Normally, various types of solar cells and energy storage systems are coupled. When illuminating, the solar cell harvests sunlight and converts it into electrical energy, where a switching-on operation between the solar cell and the energy storage device allows to input the electrical energy into the energy storage device.

Should solar cells be integrated with energy storage devices?

A notable fact when integrating solar cells and energy storage devices is the mismatch between them, for example, a battery with a capacity much more higher than what the PV cell can provide per charging cycle.

What are the components of a solar-driven integrated system?

A typical solar-driven integrated system is mainly composed of two components: an energy harvesting module (PV cells and semiconductor photoelectrode) and an energy storage module (supercapacitors, metal-ion batteries, metal-air batteries, redox flow batteries, lithium metal batteries etc. [1, 2, 3]).

How can solar energy harvesting and storage be integrated?

Under solar radiation (100 mW cm^{-2}), the coupling process of photoelectron excitation and electrochemistry enhances the storage efficiency and power density of the integrated system. Thereby, high-efficiency integration of light energy harvesting and storage could be realized.

Can a molecular solar thermal energy storage system be a hybrid device?

Two main issues are (1) PV systems' efficiency drops by 10%-25% due to heating, requiring more land area, and (2) current storage technologies, like batteries, rely on unsustainably sourced materials. This paper proposes a hybrid device combining a molecular solar thermal (MOST) energy storage system with PV cell.
