

Can thermal energy storage be integrated with nuclear energy?

In particular, thermal energy storage (TES) provides several advantages when integrated with nuclear energy. First, nuclear reactors are thermal generators, meaning that fewer energy transformation mechanisms are required when thermal energy is used as the coupling energy resource.

Should nuclear energy be stored as thermal energy?

Since heat is a natural product of nuclear reactions, storing the energy produced as thermal energy seems to be an efficient means of storage. Also, storing heat is a technologically simple task so it should be a relatively cheap and reliable energy storage adaptation for nuclear power.

Should nuclear energy be stored in TES systems?

Second, TES systems would preserve nuclear energy in its original form (heat), enabling much more flexible use when the stored energy is recovered (e.g., electricity production or steam supply for industrial systems).

Is nuclear power a good source of low-carbon electricity?

Nuclear power is the second-largest source of low-carbon electricity today, with 452 operating reactors providing 2700 TWh of electricity in 2018, or 10% of global electricity supply. In advanced economies, nuclear has long been the largest source of low-carbon electricity, providing 18% of supply in 2018. Yet nuclear is quickly losing ground.

How do nuclear power plants contribute to electricity security?

Nuclear power plants contribute to electricity security in multiple ways. Nuclear plants help to keep power grids stable. To a certain extent, they can adjust their operations to follow demand and supply shifts. As the share of variable renewables like wind and solar photovoltaics (PV) rises, the need for such services will increase.

Can advanced nuclear energy be commercially viable?

Advanced nuclear can theoretically provide 9000 years of renewable energy from those reserves at today's energy demand, and that is not taking into account the legacy nuclear 'waste' now safely stored, which can become fuel for advanced reactors. Advanced technology can be commercially viable in the United States by the 2030s.
