

Steel to cover unevenness between self-cooling casing

Abstract The unevenness of the solid-shell and heat flux (q) during solidification were measured for various steel grades with casting apparatus. Then the data were used to develop a model ...

As a new drilling technique, the self-drilling anchor bolt can be a good substitute for casing drilling, and the overall cost is lower. This blog will introduce the differences ...

The study investigates the impact of heat flux differences between the wide and narrow faces of continuous casting molds on the solidification of hypo-peritectic steel, particularly focusing on ...

Steel to cover unevenness between self-cooling casing
