

When do the energy storage standards apply?

When do the Standards Apply? The 2022 Energy Code now requires that all single-family buildings with one or two dwelling units must be energy storage (battery storage) system ready. What are the Energy Storage Systems Ready Requirements (ESS)?

What is required working space in and around the energy storage system?

The required working spaces in and around the energy storage system must also comply with 110.26. Working space is measured from the edge of the ESS modules, battery cabinets, racks, or trays.

How do I plan a new energy storage system?

It is important to plan and discuss the location of an energy storage system with the electrical inspection authorities before installation of this equipment. In many cases, this will include the building inspector and the fire marshal.

Are new single-family buildings energy storage ready?

To facilitate the future installation of battery storage systems, newly constructed single-family buildings with one or two dwelling units are required to be energy storage ready.

How many volts can a dwelling unit energy storage system handle?

For dwelling units, an ESS cannot exceed 100 volts between conductors or to ground. An exception dictates that where live parts are not accessible during routine ESS maintenance, voltage exceeding 100 volts is permitted at the dwelling unit energy storage system. This information can be found at 706.30 (A).

Can pre-engineered and self-contained energy storage systems have working space?

Language found in the last paragraph at 706.10 (C) advises that pre-engineered and self-contained energy storage systems are permitted to have working space between components within the system in accordance with the manufacturer's recommendations and listing of the system.
