

The study by Ahmad et al. [23] indicates that a solar-operated trigeneration system outperformed a cogeneration system in terms of energetic output and overall efficiency, emphasizing the advantages of simultaneously producing multiple forms of useful energy. The computed results of the study indicate that the energetic output increased from 58 ...

In the present study, the operation of a trigeneration system located in the student residences of Democritus University of Thrace in Greece is examined. The system involves a combination of

all the listed power values of the trigeneration system depend on the power of the gas turbine NTG and the temperature of exhaust gases delivered to it  $T_2$ . Another extremely important issue is to develop a mathematical model of economic viability of the trigeneration system operation in such a way to use them to generalise the

The performance of an optimum solar trigeneration system configuration was investigated from the thermodynamic, economic, and environmental perspectives [6]. ... 2022, Applied Sciences (Switzerland) Concentrating solar collectors for a trigeneration system-A comparative study. 2020, Applied Sciences (Switzerland) View all citing articles on Scopus.

6 ???&#0183; To verify the productivity stability of the photovoltaic thermal heat pump system under trigeneration condition, the combined cooling, heating and photovoltaic operation of the system in summer was conducted. During the 7 days trigeneration operation of the system, the average heating power of the system during the 8-h daytime heating operation ...

Therefore, (1) a novel LAES based trigeneration system by using the compression heat and the cascade expansion cold energy was proposed, which can be flexibly adjusted to meet the cooling, heating and power requirements of different seasons; (2) the analysis of the system was carried out from the thermo-economics view with variable operating ...

1 ??&#0183; This work presents a novel trigeneration system for the simultaneous production of desalinated water, electrical energy, and cooling, addressing the challenges of water scarcity and climate change through an integrated and efficient approach. The proposed system combines an 8-stage Multi Stage Flash Distillation (MSF) process with a 6-effect Multiple Effect Distillation ...

The results showed an increase in the exergetic efficiency from 51.9% to 84.5% when using a trigeneration system based on biomass instead of the conventional non-integrated system.

In this research, a novel trigeneration powered by a renewable energy (RE) source is developed and analyzed. The trigeneration system is designed to produce electricity, hot water, and cooling using two steam cycles, a gas cycle, hot water chamber, and an absorption cycle. The RE source considered in the scope of this study is biogas generated from chicken ...

The results demonstrate that the double-flash trigeneration system (system 2) performs better from exergy and exergoeconomic viewpoints than the single flash-based one (system 1), leading to the achievement of the system's optimum values for net power output, hydrogen production rate, desalinated water rate, and energy and exergy efficiencies ...

The environmental performance of a combined cooling, heating, and power system is analyzed in this study at a component-level using a SPECO-based exergoenvironmental analysis. The engine consumes natural gas and produces 168.6 kW net power. The waste heat is recovered by a LiBr-H<sub>2</sub>O absorption chiller and a heat exchanger, ...

The trigeneration system's performance for different design scenarios is then parametrically investigated using a simulation model. For each scenario, energy, environmental and economic indicators are calculated and the cost-optimal designs are extracted. In the cost-optimal implementation, the system covered 18.19-36.39% and 3.58-15.71% ...
