## Does rice waste biochar Husk have a good electrochemical performance?

The electrochemical results of the EES electrodes from rice biochar materials have determined the considerable electrochemical performance of the rice wastes biochar (especially rice husk). The rice wastes have three significant advantages including environmental, economical, and electrochemical features.

Can rice husk be used for biomass valorization?

Rice has been widely cultivated in the world especially in Asian countries. Therefore, rice wastes especially rice husk can be used for biomass valorization procedures. The rice biochar materials have been used to fabricate the EES electrodes including the electrodes of the batteries, supercapacitors, and hybrid EES devices.

Can rice waste be used for the preparation of EES electrodes?

Also,rice wastes can be used for the preparation of the EES electrodes. The EES devices have four main parts including electrodes (anode and cathode), binder, electrolyte, and membrane (separator). The electrodes have the most significant role in the performance of the EES devices.

Can rice waste be used for hybrid EES devices?

Using rice wastes not only reduced the environmental pollutions and production costs but also improve the electrochemical properties of the EES devices. Hence, this process should be developed in the next studies especially for the preparation of the hybrid EES devices. The EES devices have a great influence on modern life.

Can biochar modification improve the electrochemical performance of rice wastes?

The rice wastes have three significant advantages including environmental, economical, and electrochemical features. The next studies should develop different biochar modification techniques to enhance the electrochemical performance of the biochar materials.

Are porous carbons derived from rice husk suitable for supercapacitors?

Xiao Y, Zheng M, Chen X, Feng H, Dong H, Hu H, Liang Y, Jiang SP, Liu Y (2017) Hierarchical porous carbons derived from rice husk for supercapacitors with high activity and high capacitance retention capability.
