

The present results provide new insights into the understanding of the lithium storage mechanism of ZnS and the revealing of the effects of interfacial interaction on lithium storage performance ...

Aqueous rechargeable Zn/MnO₂ zinc-ion batteries (ZIBs) are reviving recently due to their low cost, non-toxicity, and natural abundance. However, their energy storage mechanism remains controversial due to their ...

The energy storage mechanism is clarified by a series of ex-situ tests: ... [25] and ZnS [26] have been reported, and they have different mechanism for storing and releasing energy. In ...

To maximize the use of ZnS low-dimensional nanoparticles as high-performance supercapacitor electrodes, this work describes a simple one-pot synthesis method for producing a cluster of these particles. The ZnS ...

As shown in Figure 2b, under the same strain conditions, the formation of ZB structure is comparable to the change trend of RS structure, but the ZB structure is broader other words, the ZB structure is generally more ...

Aqueous zinc (Zn) metal batteries are considered competitive candidates for next-generation energy storage, attributed to the abundance, low redox potential, and high theoretical capacity of Zn. However, conventional ...

In addition, the sodium storage mechanism of ZnS exhibits both alloying reaction and conversion reaction characteristics, which results in a significant volume change at the ZnS electrode, ...

The detailed Li-ion storage properties of yolk-shell ZnS@C nanorods: a) CV curves; b) discharge/charge profiles; c) cycle capability at 0.2 A g⁻¹; discharge/charge curves ...
