Are energy storage systems safe?

The emergence of energy storage systems (ESSs), due to production from alternative energies such as wind and solar installations, has driven the need for installation requirements within the National Electrical Code (NEC) for the safe installation of these energy storage systems.

What is required working space in and around the energy storage system?

The required working spaces in and around the energy storage system must also comply with 110.26. Working space is measured from the edge of the ESS modules, battery cabinets, racks, or trays.

Are energy storage systems connected to other energy sources?

Energy storage systems can be (and typically are) connected to other energy sources, such as the local utility distribution system. There may be one or more sources connected to an ESS. The connection to other energy sources is required to comply with the requirements of 705.12.

Does a pre-engineered or self-contained energy storage system need ventilation?

Provisions need to be made for sufficient diffusion and ventilation of any possible gases from the storage device to prevent the accumulation of an explosive mixture. A pre-engineered or self-contained energy storage system is permitted to provide ventilation in accordance with the manufacturer's recommendations and listing for the system.

Can a battery shelf contact a wall?

Energy storage system modules, battery cabinets, racks, or trays are permitted to contact adjacent walls or structures, provided that the battery shelf has a free air space for not less than 90 percent of its length.

How do I plan a new energy storage system?

It is important to plan and discuss the location of an energy storage system with the electrical inspection authorities before installation of this equipment. In many cases, this will include the building inspector and the fire marshal.
