

An integrated energy system is one of the most effective measures to enhance the flexibility of an electrical power system [1, 2]. The combined heat and power (CHP) unit is ...

In 2022, the United States had two concentrating solar thermal-electric power plants, with thermal energy storage components with a combined thermal storage-power capacity of 450 MW. The ...

The development of large-scale, low-cost, and high-efficiency energy storage technology is imperative for the establishment of a novel power system based on renewable ...

Increasing the share of renewable energy in the future electricity market requires measures to maintain the stability of the grid, owing to the volatility and intermittency of ...

Zhang et al. [17] established a frequency regulation control model of the thermal power combined energy storage system based on flywheel and lithium battery hybrid energy ...

The potential of improvement of both overall energy efficiency and penetration of renewable energy for the combined heat and power (CHP) unit was investigated by integrating the source ...

This provides firm and highly flexible power with relatively little fuel consumption, thanks to the integration of thermal energy storage, photovoltaic electricity and ...

AbstractEmploying thermal energy storage (TES) for combined heat and power (CHP) can improve flexibility in an integrated electric-thermal system (IETS) and therefore is ...

In recent years, the supercritical carbon dioxide (sCO₂) Brayton cycle power generation system has gradually attracted the attention of academics as a solar thermal power ...

Thermochemical heat storage is a technology under development with potentially high-energy densities. The binding energy of a working pair, for example, a hydrating salt and water, is used for thermal ...
