

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

How will energy storage systems impact the developing world?

Mainstreaming energy storage systems in the developing world will be a game changer. They will accelerate much wider access to electricity, while also enabling much greater use of renewable energy, so helping the world to meet its net zero, decarbonization targets.

How can energy storage improve reliability?

These are characterized by poor security of supply, driven by a combination of insufficient, unreliable and inflexible generation capacity, underdeveloped or non-existent grid infrastructure, a lack of adequate monitoring and control equipment, and a lack of maintenance. In this context, energy storage can help enhance reliability.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Why do we need long-term energy storage?

For example, community hospitals must have refrigeration to cool their medicines. Long-duration energy storage gives them greater assurance. Take the Maldives, which consists of nearly 1,200 coral islands in the Indian Ocean. Fossil fuels have powered the islands.
