Can compressed air energy storage systems be used for air conditioning?

This work presents findings on utilizing the expansion stage of compressed air energy storage systems for air conditioning purposes. The proposed setup is an ancillary installation to an existing compressed air energy storage setup and is used to produce chilled water at temperatures as low as 5 °C.

Can thermal management of compressed air energy storage systems provide alternative cooling methods?

That is equivalent to 345.8 Wh and 318.16 Wh respectively (3320/3600 °; 375&345). This work examined the potential of using the thermal management of compressed air energy storage systems to provide an alternative to conventional cooling methods.

Does a compressed air energy storage system have a cooling potential?

This work experimentally investigates the cooling potential availed by the thermal management of a compressed air energy storage system. The heat generation/rejection caused by gas compression and decompression, respectively, is usually treated as a by-product of CAES systems.

Why is energy storage important for air conditioning?

This reduces the reliance on conventional air conditioning units, which are the major consumers of electrical power. Also, the energy storage process has seen around 4% enhancement in roundtrip efficiency by employing the air heating by chilling the water for air conditioning purposes.
