

How does a tourbillon watch work?

The tourbillon increases accuracy for watches held in the upright position. While a traditional movement sends its power to the locking and unlocking mechanism of the escapement to prevent it winding down all in one go, a tourbillon watch sends the power first to the tourbillon cage, which houses the escapement.

How do tourbillons work?

In a tourbillon, the escapement and balance wheel are mounted in a rotating cage, with the goal of eliminating errors of poise in the balance giving a uniform weight. Tourbillons are still included in some modern wristwatches, where the mechanism is usually exposed on the watch's face to showcase it.

Are tourbillons still used?

Tourbillons are still included in some modern wristwatches, where the mechanism is usually exposed on the watch's face to showcase it. Patented by Breguet in 1801, the single axis tourbillon minimizes the difference in rate between positions caused by poise errors.

Does gravity affect a tourbillon?

As Breguet discovered, gravity affects watches, but tourbillons counteracted this by averaging out errors. Whether it's the simplest or most complex tourbillon, this is not a complication (any timekeeping function beyond basic minutes and seconds functionality).

Do you really need a tourbillon?

Tourbillons may be relatively commonplace and increasingly accessible. Yet, though their raison d'être is long gone, the appeal of sophisticated engineering and workmanship in even a basic tourbillon endures. A tourbillon may not be essential for timekeeping, but it's a really cool feature to have in your watch.

How does a tourbillon cage work?

Tourbillon cages may take on a variety of styles, but like a balance wheel, should have high inertia while being as light as possible. Now that the cage is rotating, how is power delivered to the balance wheel? The answer is simpler than you may think: under the cage and fixed to the movement's baseplate is a stationary fourth wheel.

Hello. I am currently trying to learn about how a watch works with a tourbillon, and I am not really getting the part about it. As far as I can see, the tourbillon is used to make the clock "tick" at a ...

Conceived by the British watchmaker and inventor John Arnold, it was developed by his friend the Swiss-French watchmaker Abraham-Louis Breguet and patented by Breguet on 26 June 1801.
