

Why are trams with energy storage important?

Trams with energy storage are popular for their energy efficiency and reduced operational risk. An effective energy management strategy is optimized to enable a reasonable distribution of demand power among the storage elements, efficient use of energy as well as enhance the service life of the hybrid energy storage system (HESS).

Can EVs be used as energy storage for the tram network?

Therefore, this research assumes that the tram service provider would provide the EV owners, who allow their EVs to be used as energy storage for the tram network, with incentives (e.g. discounted travel perhaps) to compensate for the extra degradation of the EV battery.

Does the ESS provide its own energy to the tram?

Conversely, if the increase of E_{reg} is less than the reduction of energy from E_{sub} , then the ESS provides its own energy to the tram.

How are tram travel data collected?

1. The distance, speed, acceleration and altitude data of example tram journeys that covers all the routes and stops was collected, initially on a second by second basis via a dedicated GPS device, with data collection covering both morning (08:00-12:00) and afternoon (14:00-18:00) travel patterns, on three different weekdays in June 2018. 2.

What is energy management in a hybrid energy storage system?

Therefore, the energy management of a hybrid energy storage system (HESS) is a key issue to be studied. Through the application of effective energy management control techniques, the power performance of the HESS is ensured, the power braking energy is effectively utilized and the service life of the HESS is enhanced.

Why is EMS important in multimodal traction systems?

The EMS is of great importance for safe, reliable, and energy-efficient operation of the multimodal traction system. The following section reviews the architectures and energy management strategies of real multimodal trains. For battery hybrid trains, the onboard energy can be stored in several submodules.

Global demand for energy storage systems is expected to grow by up to 25 percent by 2030 due to the need for flexibility in the energy market and increasing energy independence. This demand is leading to the development of storage ...
