

How effective was the Sendai microgrid after the earthquake?

Despite the extreme devastation, the Sendai Microgrid resumed supplying power and heat to customers after a short interruption, proving its effectiveness. This case study is an analysis of the operations of the Sendai Microgrid in the aftermath of the earthquake and will provide useful lessons for all microgrid operators and users around the world.

What is the Sendai microgrid?

The Sendai Microgrid was initially designed in 2004 as a test bed for a demonstration project of NEDO. After the study was completed in 2008, the microgrid system has continued in operation under the management of NTT Facilities, Inc.

What happened to Sendai microgrid in Tohoku?

As described above, the earthquake caused massive damage to the Tohoku district where the Sendai Microgrid is located. When the earthquake occurred, Tohoku EPC stopped supplying power to the area surrounding the Sendai Microgrid, resulting in a three-day outage.

Why did the Sendai microgrid switch to island mode?

Beginning several tens of seconds after the occurrence of the earthquake at 14:46 on March 11, there were a series of major voltage fluctuations in Tohoku EPC's commercial grid, then a gradual drop in voltage, leading to the outage. Accordingly, the Sendai Microgrid switched over to island mode.

Why did Tohoku EPC stop supplying power to the Sendai microgrid?

When the earthquake occurred, Tohoku EPC stopped supplying power to the area surrounding the Sendai Microgrid, resulting in a three-day outage. Nevertheless, the Sendai Microgrid was able to supply power to loads within its service area continuously.

Where is Nedo implementing a smart grid project in New Mexico?

For the period between FY2009 and FY2014, the Japan - U.S. Collaborative Smart Grid Demonstration Project in New Mexico was implemented at two sites, Los Alamos and Albuquerque in New Mexico State in the United States as NEDO's first Overseas Smart Community Demonstration Project.

This case study describes the Sendai Microgrid, on the located campus of Tohoku Fukushi University in Sendai City in Tohoku the district in Japan, and focusses on its operation in the ...

Microgrids are crucial for maintaining uninterrupted power supply during emergencies, particularly in critical facilities like hospitals, evacuation shelters, and water treatment plants. For example, the Sendai microgrid demonstrated its effectiveness during the 2011 Great East Japan Earthquake, supplying consistent energy when the main grid ...

Microgrids hold the promise for providing electricity supply during catastrophic events, as was the case with the Sendai microgrid during the Fukushima Daiichi nuclear meltdown event in 2011. Microgrids are increasingly accepted as utility-approved components of a distribution grid. Costs are falling of environment-friendly generation assets.

The Sendai Microgrid shown in Fig. 3.8 was one of four New Energy and Industrial Technology Development Organization (NEDO) microgrid demonstration projects conducted between 2006 and 2008. This project was intended to demonstrate the delivery of multiple power qualities to various circuits on the small Tohoku Fukushi University campus and ...

Navigant Research reports that the microgrid market is "heating up quickly" around the world with North America at the forefront, expecting worldwide microgrid capacity to grow to more than 4,000 megawatts by 2020. Canadian Solar, one of the world's largest solar power companies, has opened a microgrid test center in Ontario that will

The extremely intense vibrations severely damaged electric utility facilities, and the subsequent tsunami washed away many coastal towns and villages. The Sendai Microgrid at Tohoku Fukushi ...
