

What are the operation modes of a Hybrid UPS?

The operation modes of the hybrid UPS can be categorized into a charge mode, a discharge mode, a power exchange mode, and an emergency mode. Figure 2 a shows the charge mode in normal operation. It operates at midnight, when electricity charges are low; it also stores power in the battery, and the critical load receives power from the grid.

How a hybrid energy storage UPS system works?

Block Diagram of hybrid energy storage UPS system. The Fuel cell is the main source of energy. Batteries and super-capacitor act as secondary source of energy. Fuel cell is linked to DC-Bus through the DC-DC converter while all other sources are linked to the common DC-Bus through bidirectional converter.

How to regulate the output of a UPS system?

Generally the output of the UPS system must be regulated sinusoidal with low total harmonic distortion (THD), irrespective of the changes in the input voltage and abrupt changes in the load connected to the system .

What are the factors affecting the UPS system?

Besides, low transients response time from online mode to battery powered mode and vice versa, unity power factor, high reliability, high efficiency, low cost, low weight, and small size, etc. are other essential considerations in the UPS system. Broadly the UPS can be classified as the Static UPS system and Rotary UPS system.

What is uninterruptible power supply (UPS)?

Uninterruptible Power Supplies (UPS) have reached a mature level by providing clean and uninterruptible power to the sensitive loads in all grid conditions. Generally UPS system provides regulated sinusoidal output voltage, with low total harmonics distortion (THD), and high input power factor irrespective of the changes in the grid voltage.

Can uninterruptible power supplies be used as a hybrid storage system?

Uninterruptible Power Supplies with hybrid storage system Uninterruptible power supplies with batteries as storage source provides good performance during grid interruption and blackout by supplying instant backup energy. However batteries cannot provide backup for a very long period of time and have limited charge/discharge cycles.
